

## Archeological site of Castro del Pedroso

The fort is located on a hill with an irregular plan bounded by an irregularly shaped 3-hectare walled enclosure, and reinforced in some places by flagstones. You can also identify a circular structure attached to the inside of the wall. In the western part, the area for housing could be located, since it is in this area where the greatest number of ceramic remains of the entire castro has been found. Due to these ceramic findings, it could be dated between the Neolithic and the Initial Bronze, and can even go as far as the Iron Age. They also determined that there is a clear relationship between Castro del Pedroso and neighboring Portuguese forts. There are schematic engravings on the granite but very deteriorated.

### Historical Data

---

**Architecture:** Archaeology site

**Construction:** Neolithic fortified settlement

**Historical Period:** , Neolithic Bronze Age

### Address

---

En la margen derecha del río Manzanas. San Martín del Pedroso (Trabazos). 49517 Zamora.
